Experiment 5

Codeforces 514 C

Input	O/P
23	Yes
aaaaa	No
acacaca	No
aabaa	
ccacacc	
caaac	

Approach

i) Store all memory string a set.

ii) For each query string

- Try changing each position.
- Replace it with other two possible characters.
- check if modified string exists in set.

iii) Because:

- only 3 characters → at each index only 2 replacements possible.
- if length = L → total checks = 2L.
- Total operations = O (total length).

Code

```
int n, m;
Scanner sc = new Scanner (System.in);
n = sc.nextInt();
m = sc.nextInt();
Set<String> st = new HashSet();
for (int i = 0; i<n; i++) {
        String s = sc.nextLine();
        st.add(s);
}
```

```
while(m--){
        String s = sc.nextLine();
        boolean found = false;
}
for(int i=0; i<s.length() && !found; i++){
            char original = s.charAt(i);
        for (char ch = 'a'; ch <= 'c'; ch++){
                if (ch==original) continue;
                s.charAt(i) = ch;
            if (set.contains (new String (arr))){
                    found = true;
                    break;
            }
        } arr[i] = original;

    if(found)
        System.out.println("Yes");
    else
        System.out.println("No");
} sc.close();
}
```
